Abstract of **JP 2000215080 (A)**

PROBLEM TO BE SOLVED: To obtain a terminal device, a repeating device, server and debug information acquisition system, debug information acquiring method, and recording medium which can obtain desired symbol information remotely without paying attention to differences of a target debug machine. SOLUTION: When a client C specifies a desired system, the specified system is connected to a system-adaptive server SS accessible to the debug information of the desired system through a virtual server VS and at a symbol conversion request for a program to be debugged, symbol information is sent from the system-adaptive server SS to the client C.
